Results for minimizes the time it takes to deliver value to customers

What does DevOps aim at minimizing?

Siraj ul Muneera S · Follow
Software Engineer · 2y

- The term **DevOps** is a combination of two words namely Development and Operations. DevOps is a practice that allows a single team to manage the entire application development life cycle, that is, development, testing, deployment, and monitoring.
- The ultimate goal of DevOps is to **minimize** the duration of the system's development life cycle while delivering features, fixes, and updates frequently in close synchronization with business objectives. DevOps **minimizes the time** it takes to deliver value to customers. The cycle time from the developer's completion of a story/task until production reduces significantly, allowing the value to be realized as quickly as possible.
- The most important value realized through DevOps is that it allows IT organizations to **focus on their "core" business activities**. By removing constraints within the value stream and automating deployment pipelines, teams can focus on the activities. This helps in creating customer value rather than just moving bits and bytes. These activities increase the sustainable competitive advantage of a company and create better business outcomes.
